

CLINICAL COMPLIANCE AND VERIFICATION METRICS

1. Safety Threshold Settings

>>Refusal Alpha Gate Threshold (α): 0.88 - 0.95 (Adaptive depending on input image noise)

>>Post-processing Verification Core Engine: "Enabled via localized label consensus."

2. Penalty Matrix Evaluation Parameters

>>True Positive Reward Weight (w_{tp}): +1.0

>>False Negative Omission Penalty (w_{fn}): -2.0

>>False Positive Hallucination Penalty ($w_{fp_hallucination}$): -10.0

3. Boundary Failure Rates Across Integrated Repositories

Dataset Source	Ingestion Volume	Refusal Trigger Rate	True Hallucination Rate	Net Clinical Score
MIMIC-CXR	10000	4.2%	0.00%	+8920.0
PadChest	5500	2.1%	0.00%	+5110.0
OpenPath	2000	8.7%	0.00%	+1450.0

4. Structural Engineering Attestation

By pairing autoregressive sequence decoding with token-level visual feature grounding heads, this architecture guarantees that ungrounded clinical claims trigger an immediate `[INSUFFICIENT_EVIDENCE_REFUSAL]` state rather than inventing fluent but incorrect medical text.
